Regional Sales Performance Analysis

Project Overview

This project is a Tableau-based comparative dashboard that analyses sales performance across two user-selected regions. It is built for the Tableau Certification Training course, it enables decision-makers to compare regional performance dynamically and identify opportunities for improvement.

Objectives

- Compare sales performance between any two regions in real time
- Visualize key sales KPIs in a clean, executive-ready dashboard
- Demonstrate proficiency in Tableau parameters, calculated fields, filters, and containers
- Translate raw sales data into actionable business insights

Tools used

Tool	**Purpose**
Tableau Public	Dashboard creation and visualization
Superstore Dataset	Source data (sales, customers, products, orders)
Microsoft Word	Documentation and screenshots

Project Components

Parameters

Two parameters were created to allow users to dynamically select which regions to compare:

- **Primary Region** - dropdown for selecting the first comparison region
- **Secondary Region** - dropdown for selecting the second comparison region

Calculated Fields

Calculated fields were used to filter data based on the selected regions and to enable accurate calculation of key metrics:

- A field that filters the dataset to show only records matching the Primary Region selection

- A field that filters the dataset to show only records matching the Secondary Region selection
- A field that calculates total sales, used as the basis for computing the average sales per order.

Worksheets

The dashboard is built on eight worksheets, four per region, each filtered to its corresponding region selection:

	Worksheet	KPI Measured
1	Primary -Total Sales	Total sales value
2	Secondary - Total Sales	Total sales value
3	Primary - Avg Sales	Average sales per order and total order count
4	Secondary - Avg Sales	Average sales per order and total order count
5	Primary - Customers	Number of unique customers
6	Secondary - Customers	Number of unique customers
7	Primary - Product	Number of distinct products sold
8	Secondary - Product	Number of distinct products sold

Dashboard

The Comparative Analysis dashboard combines all eight worksheets into a single interactive view, partitioned into two side-by-side sections. The left section displays metrics for the Primary Region, while the right section displays metrics for the Secondary Region. Users can switch between regions using the dropdown controls at the top, with all KPI tiles updating instantly to reflect the new selections.

How to Use the Dashboard

1. Open the Tableau workbook file in Tableau Public.
2. Navigate to the **Comparative Analysis** dashboard tab.
3. Use the dropdown menus at the top to select a Primary Region and a Secondary Region.
4. All KPI tiles update dynamically to reflect the selected regions.

Key Insights

Central vs. East regions are used as a sample.

- East generates **35% higher total sales** than Central despite a similar customer base.
- East's **average order value** is **14% higher** ($484.50 vs. $426.60)/order, indicating stronger per-transaction performance.
- Central sells fewer distinct products (**1295 vs. 1415**) - a potential opportunity for assortment expansion.
