Project Overview

This project delivers an interactive Tableau dashboard that enables side-by-side comparison of sales performance between two user-selected regions. Built on the Sample Superstore dataset, the dashboard supports upper management in identifying performance gaps and informing data-driven decisions.

Tools and Methodology

Tools: Tableau Public, Sample Superstore dataset, Microsoft Word.

The project was executed by connecting to the dataset, organizing geographic fields into a folder, building a Location hierarchy, creating parameters and calculated fields, constructing worksheets, assembling a partitioned dashboard, and publishing the final output to Tableau Public.

Project Components

Data Organization: Geographic fields (Region, Country, State, City, Postal Code) were grouped into a custom Location folder, and a Location hierarchy was created following this structure: (Country → Region → State → City →Postal code).

Parameters: Two string-based parameters, Primary Region and Secondary Region, were created with dropdown lists populated from the Region field.

Calculated Fields: Multiple calculated fields were built to support the dashboard. Boolean filters **(Is Primary Region, Is Secondary Region)** handle region-based filtering against the parameter selections. The remaining fields drive the KPI displays: First Order Date, Average Sales per Order, Number of Customers, Number of Orders, and Number of Products in Sale.

Worksheets: Four worksheets were constructed. Two consolidated performance summary tables (one per region) display five numeric KPIs using Measure Names and Measure Values, and two dedicated First Order Date worksheets display the date separately due to its incompatibility with the Measure Values shelf.

KPIs Displayed: First Order Date, Total Sales, Average Sales per Order, Number of Customers, Number of Orders, and Number of Products in Sale.

Dashboard

The final dashboard, titled Regional Sales Comparison, consolidates all four worksheets into a single interactive view. The layout is partitioned into two side-by-side sections using nested containers, with the Primary Region on the left and the Secondary Region on the right. Users can switch between regions using the dropdown controls at the top, and all KPI tiles update instantly to reflect the new selections.

Key Insights and Recommendations

Based on a comparison between two regions, the dashboard reveals notable differences in sales volume, average order value, and product range. Higher-performing regions tend to demonstrate stronger upselling and broader product assortments. Recommended actions include investigating the sales practices of top-performing regions, expanding the product catalogue in underperforming regions, and using the dashboard for ongoing performance monitoring.
